Table 1. List of Potentially Controlled Alloys	1
Cross-reference of alloys with the EU Commerce Control List Export Control Classification Number (ECCN) for commodities that may be controlled if made of an alloy. Each alloy is listed alphabetically and is cross-referenced to a commodity type and an ECCN. Each alloy also has either the base element of the alloy or an alloy type (such as Maraging Steel).	
Table2. EU Commerce Control List Language.....	207
EU Commerce Control List ECCNs (from 5 May 2009) that apply to commodities controlled in part or whole based on their material of construction. The full text of the requirements describing the physical requirements of the commodity (size, capacity, capabilities, etc.) and the material requirements for the commodity (composition, strength, etc.) are included. Usually both of these are required in order to determine if an item is controlled.	
Table 3. HS Codes to ECCN.....	233
Numerical listing of six-digit international Harmonized System (HS) codes for products which may be controlled because of the material of construction cross referenced to the appropriate ECCN. This is based on a correlation developed between the World Customs Organization (WCO) HS codes and the EU Dual-Use Control List. It is provided here for information purposes.

The Metals Handbook is meant to be a field guide for assisting enforcement officials in recognizing controlled commodities. It should not be used to make licensing decisions. Officials must confirm alloy properties and control language from the appropriate references.

Introduction

Metal alloys are, for the most part, visually similar, and differentiating rare controlled alloys from common industrial grade alloys can be difficult. Not only are some alloys themselves export controlled, but controls on certain commodities are in part based on their alloy of construction. Even when alloys are properly identified on the associated shipment paperwork, it is often difficult to determine if a commodity meets a control specification because of the multitude of alloy nomenclatures. In addition, the associated control language seldom specifies alloys by name. Rather, other characteristics of the alloy determine if it is controlled (e.g., high strength aluminium in certain tubular configurations). Enforcement personnel face a difficult challenge in attempting to prevent illicit shipments of commodities controlled, at least in part, based on their material of construction.

This handbook is intended to assist field officers in determining whether a commodity made of a particular alloy may be subject to export control regulations based upon EU Commerce Control List. These includes controls derived from the Missile Technology Control Regime (MTCR), Nuclear Suppliers Group (NSG), Australia Group (AG), and Wassenaar Arrangement (WA). A list of potentially controlled alloys was developed by comparing the control lists published by these export control regimes against the characteristics of commercially available alloys. Due to the large number of alloy designations, the handbook does not include every possible controlled alloy. A few alloys are controlled by themselves but most are controlled as a material of construction for commodities controlled by the multilateral export control regimes.

This handbook provides a cross-reference between alloy names and control list requirements, but cannot be used by itself to determine if a commodity is controlled. There are inherent limitations to the handbook; it does not include all commodities whose controls are associated with materials of construction, nor does it include all possible alloys that may meet a particular control list specification. Control determination will depend on comparing the characteristics of the commodity against the actual control language, either in the national control list and/or against the appropriate regimes' control specification.

Export controls for items made of metal or containing metal can be grouped into four broad categories:

- Unspecified Forms
Controls which apply only to the material itself. The items made of these materials are controlled regardless of the size, shape or form (i.e., can be in any form).
- Crude or semi-fabricated forms
Controls which apply to metal items which are not finished products, but are controlled in their crude or semi-fabricated forms (e.g., high strength aluminium in a golf club shaft would not be controlled, but in an ingot it might be).
- Metallic powders
Controls which apply to powders of certain size and quality specifications and made of certain metals.
- Finished Products
Controls that apply to a short list of manufactured goods provided in a specific form, size and/or capacity, and made of certain metals. I.e., a commodity that meets other control specifications may be controlled if it is made of a specific metal.
 - Agitators
 - Bearing or Bearing Systems
 - Crucibles
 - Distillation or absorption columns
 - Filling equipment
 - Heat exchangers or condensers

- Incinerators
- Pumps, multiple seal and seal-less
- Multi-walled piping
- Pressure Sensors
- Reaction vessels
- Sheet metal or plates
- Tanks
- Tubes or tubing
- Valves

Collectively these Finished Product groups coupled with the other classifiers (e.g., Unspecified Forms, Crude Forms, etc.) are known as “Commodity Type” for use in the Metals Handbook.

Limitations of the handbook include:

- 1) Does not include commodities whose controls are derived from other international arrangements or under unilateral controls.
- 2) Does not include items from the NSG Trigger List (TL). The NSG TL is illustrative in nature. In general, the NSG TL commodities are controlled regardless of the material of construction. When material of construction is provided in the NSG TL control language it is an example and not part of the control specification.
- 3) Does not include controls associated with parameters for which alloy specifications are not commonly published (e.g., magnetic permeability, stress-rupture life, low cycle fatigue life).
- 4) Does not include uncommon, proprietary, and industry-specific alloy names. With hundreds of national, organizational, and vendor specific alloy standards, it is impossible to list all alloys meeting all control specifications.

The Metals Handbook is meant to be a field guide for assisting enforcement officials in recognizing controlled commodities. It should not be used to make licensing decisions. Officials must confirm alloy properties and control language from the appropriate references.

Usage Guide and Examples

In general, inspectors in the field know the type of commodity they are inspecting. For example, an inspector knows if he/she is looking at a collection of tubes, raw ingots, a tank, etc. To use this handbook, he/she must also know the material of construction for the commodity. This can be obtained from a variety of sources, including manifest information, nameplate data, contacting the vendor/shipper, or through testing with portable metal analyzers. This handbook is structured for use by inspectors with the following sets of information:

- 1) Start in Table 1 with material of construction, then match to commodity in Table 2. See examples 1 – 4.

General notes on usage of the handbook:

- a) Alloy names are often spelled many different ways. For example, "Stainless Steel 316" may be listed in a manifest or technical specifications as: 316 SS, SS 316, SS316, 316SS, 316-SS, AISI 316, SS-316 or just 316. Users of the handbook can expect to see alloys listed with various spellings and spacing between parts of an alloy's name.
- b) In general, the tables can look intimidating. Many alloys are controlled for more than one commodity and some commodities are linked to more than one control. When you find the alloy you want, study the entry carefully and follow each link to the actual control language to gain a complete understanding of controls and how they apply to a specific commodity.

Example 1: 80 mm tube manifested as made from "ALBEMET 162"

- 1) Check to see if "ALBEMET 162" is listed in Table 1.
- 2) "ALBEMET 162" is listed. It is a beryllium alloy with more than 50% beryllium.
- 3) "ALBEMET 162" is linked to the following commodities and controls, "Bearings or bearing systems (2A001.a, Ni>25, see page 226), Unspecified forms (1C230, Be>50, see page 225)"
- 4) Look up the controls 2A001 and 1C230 in Table 2. There are several exceptions listed in the control language for both controls. This commodity is not part of a bearing system so 2A001 does not apply. This commodity matches the requirements of 1C230.

Example 2: Heat exchanger with 10 m² of surface area, manifested as made from "AMDRY 723"

- 1) Check to see if "AMDRY 723" is listed in Table 1.
- 2) "AMDRY 723" is listed. It is a nickel alloy with more than 60% nickel.
- 3) "AMDRY 723" is linked to the following commodities and controls, "Chem Equip (2B350, Ni>40 see page 207), Pressure sensors (2B230.a, Ni>60, see page 228), Valves (2A226, Ni>60, see page 227)"
- 4) Go to page 207 and used the cross reference table to find the control for Heat Exchangers and Ni>40. That control is 2B350.d.5. located on page 229.
- 5) Go to page 229 and compare the commodity description and specifications against this heat exchanger.
- 6) This commodity matches the requirements for 2B350.d.5.

Example 3: Billets manifested as made from “AM3765”

- 1) Check to see if “AM3765” is listed in Table 1.
- 2) “AM3765” is not an alloy included in this handbook. Additional research is required to determine if “AM3765” is controlled and for what commodities.

Note: It is recommended that before investing time to determine the characteristics of “AM3765,” thoroughly research the commodity identification, determine if any controls might apply and if they include specifications for material of construction. See Table 2.

Example 4: Turboexpander manifested as made from “316 SS”

- 1) Check to see if “316 SS” is listed in Table 1.
- 2) “316 SS” is listed as “Does not meet requirements of any control in Table 2”
- 3) No commodity export control specifications include “316 SS” as part of their control specification. However, turboexpanders are controlled under 1B232 which applies no matter what the material of construction. 1B232 is not listed in Table 2 since it does not specify a material of construction.

Note: This example illustrates that most controlled commodities do not include material of construction as part of their control specification. This handbook is only valid for those commodities listed in Table 2.

Glossary

Term	Definition
AG	Australia Group
Al	Aluminium, Element, Atomic Number 13
Alloy	Combination of a metallic element with one or more other elements
Alloy Type	Generally, alloys are known by the element that has the highest percentage in the alloy content. For example, Zirconium alloys have more Zirconium than any other element. Other alloys may be known by common industry names (e.g., Brass, Steel, Monel, etc.)
Be	Beryllium, Element, Atomic Number 4
Bi	Bismuth, Element, Atomic Number 83
Commodity	Items that are bought, sold, and shipped. Can be a crude form (e.g., an ingot of hafnium), semi-fabricated (e.g., partially machined aircraft part), or a fabricated (manufactured) product (e.g., heat exchanger)
Commodity Type	For the purposes of this handbook different commodities have been grouped into common, field recognizable groups (e.g., tubes, valves, heat exchangers, etc.)
CPC	Customs Procedure Codes (CPC)
Cr	Chromium, Element, Atomic Number 24
Crude Form	Anodes, balls, bars (including notched bars and wire bars), billets, blocks, blooms, brickets, cakes, cathodes, crystals, cubes ,dice, grains, granules, ingots, lumps, pellets, pigs, powder, rondelles, shot, slabs, slugs, sponge, sticks, etc.
DUL	Dual-Use List
Element	Any substance that cannot be broken down into a simpler one by a chemical reaction. Elements consist of atoms with the same number of protons in their nucleus. Ninety-two occur naturally on Earth (e.g., hydrogen, oxygen, copper, iron, zirconium)
EU	European Union
GPa	Gigapascal. One billion pascals
Hf	Hafnium, Element, Atomic Number 72
HS	The International Harmonized Commodity Description and Coding System
ISO	International Standards Organization
Mo	Molybdenum, Element, Atomic Number 42
MPa	Megapascal. One million pascals
MS	Maraging Steel
MTCR	Missile Technology Control Regime
Nb	Niobium, Element, Atomic Number 41. Also known as Columbium
Ni	Nickel, Element, Atomic Number 28
NSG	Nuclear Suppliers Group
Pascal	Metric unit of pressure, internal pressure, stress, Young's modulus, and tensile strength. It is a measure of force per unit area (i.e., one newton per m ²)
Semi-Fabricated	Wrought or worked materials fabricated by rolling, drawing, extruding, forging, impact extruding, pressing, graining, atomizing, and grinding, i.e.: angles, channels, circles, discs, dust, flakes, foils and leaf, forging, plate, powder, pressings and stampings, ribbons, rings, rods (including bare welding rods, wire rods, and rolled wire), sections, shapes, sheets, strip, pipe and tubes (including tube rounds, squares, and hollows), drawn or extruded wire; and cast material produced by casting in sand, die, metal, plaster or other types of molds, including high pressure castings, sintered forms, and forms made by powder metallurgy
SS	Stainless Steel

Ta	Tantalum, Element, Atomic Number 73
Ti	Titanium, Element, Atomic Number 22
TL	Trigger List
TS	Tool Steel
UD	Undetermined
UNS	Unified Numbering System for Metals and Alloys
Unspecified	Some alloys are controlled regardless of their form. Control language often lists these as "compounds, manufactures thereof, waste or scrap"
Form	
USA	United States of America
UTS	Ultimate Tensile Strength
W	Tungsten, Element, Atomic Number 74. Also known as Wolfram
Zr	Zirconium, Element, Atomic Number 40

Table 2. EU Commerce Control Language

Commodity Categories vs. Alloy types under 2B350 Chemical Equipment

Many of the alloys listed in Table 1 are controlled because their high resistance to corrosion makes them suitable for use in chemical processing equipment that might be used to project chemical weapons. When you find an alloy that is suitable for chemical equipment, use this cross reference table to see the applicable commodity types, control section numbers and a page reference to the full text of the controls.
